

Asphalt BUR

Asphalt Built-up Roofing can be used in both new construction and existing buildings. This system gets the name “built-up” because of the multiple layers of alternating asphalt and saturated felts or fiberglass mat roofing plies.

These systems can be long lasting and durable when properly installed with quality bitumen, felts and flashings. Surfaces (gravel, coatings, or granules) extend the life of a BUR roof by providing weatherproofing and protection from UV exposure.

BUR systems have low flexibility and therefore are only appropriate on roof decks with minimal movement. BUR systems require periodic maintenance to maximize their service life.
