

EPDM (ethylene propylene diene monomer)

This is commonly referred to as “rubber” roofing. Single-ply EPDM is made of high-performance synthetic rubber compound that provides outstanding weather characteristics in climates worldwide. EPDM varies in thickness from 45 mil to 90 mil, available reinforced or non-reinforced, and is typically black in color.

EPDM is one of the most popular materials for both new and reroof low-slope roofing applications based on its durability, design versatility, and installation ease.
